

Long baseline interferometry in the visible: first results of the FRIEND prototype

Marc-Antoine Martinod

Philippe Berio, Christophe Bailet, Yves Bresson, Jean-Michel Clause, Aurélie Marcotto, Florentin Millour, Anthony Meilland, Denis Mourard, Karine Perraut, Alain Spang, Michel Tallon, Isabelle Tallon-Bosc and CHARA staff

CHARA Meeting – March 2016

Outline

- Presentation of the FRIEND prototype
- Pipeline of FRIEND
- Polarization behaviour
- Optimal DIT
- First stellar diameter estimation
- Conclusion

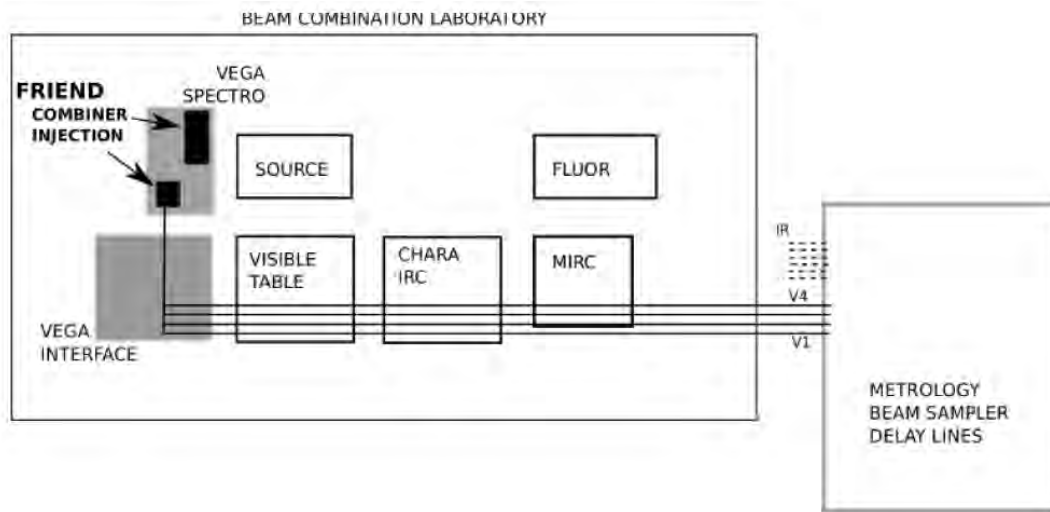

PRESENTATION OF THE FRIEND PROTOTYPE

Observatoire
de la COTE d'AZUR

Presentation of the FRIEND prototype

Presentation of the FRIEND prototype

Overall diagram

Fast and low noise EMCCD
 Optical fibers
 Limit magnitude ~ 4

Recombination module

Presentation of the FRIEND prototype

- Run :
 - Remote observations in December 2014 (2T fringes): 3 nights, $r_0 \sim 2$ cm
 - Remote observations in April/May 2015 (3T fringes): 1 night
 - July 2015: 2 nights
 - On site observations in September 2015 (lab test and sky observations): 3 nights, $r_0 \sim 2$ cm

PIPELINE OF FRIEND

Observatoire de la COTE d'AZUR

Pipeline of FRIEND

- Input : FITS file with 6000 img
- $\frac{img - \langle dark \rangle}{Gain\ map}$, Gain map (from dark histogram method)
- Sort images (hot pixel...)

Before

x

After

Pipeline of FRIEND

- On one side :
 - i. Compute PSD (Power Spectral Distribution) for each frame
 - ii. Mean them
 - iii. Delete background noise (PSD of dark and PSD of no fringes data)
 - iv. Compute $\langle E_{HF} \rangle$ by fit with 2D-gaussian

Before

After
(ii and iii)

Pipeline of FRIEND

- On the other side :
 - κ : get contribution to each beam on interferogram thanks to the measurement on photometric channels.

$$\kappa(\lambda) = \frac{I_{interf}(\lambda)}{I_{photo}(\lambda)}$$

- Congratulations, you have a squared visibility.

$$\langle |V|^2 \rangle = \frac{\langle E_{HF} \rangle}{\int_{\Delta\lambda} \kappa(\lambda) \int_{\Delta x} \langle P_1(\lambda, x) P_2(\lambda, x) \rangle dx d\lambda}$$

POLARIZATION BEHAVIOUR

Polarization behaviour

- Study of the birefringence of the optical fibers
- Purpose : improve instrumental visibility
- Lab test with internal light source of VEGA
- Protocol :
 - polarisation filter between beam splitter and V-groove
 - Turn it every 10 degrees
 - Comparison without polarisation filter

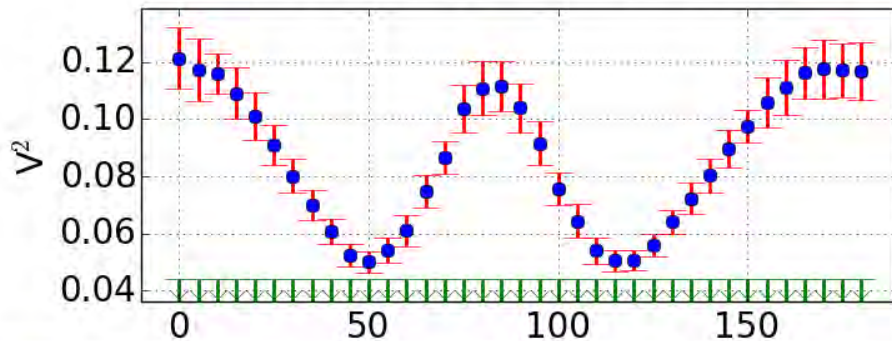

Lazareff et al., A&A, 2012

Polarization behaviour

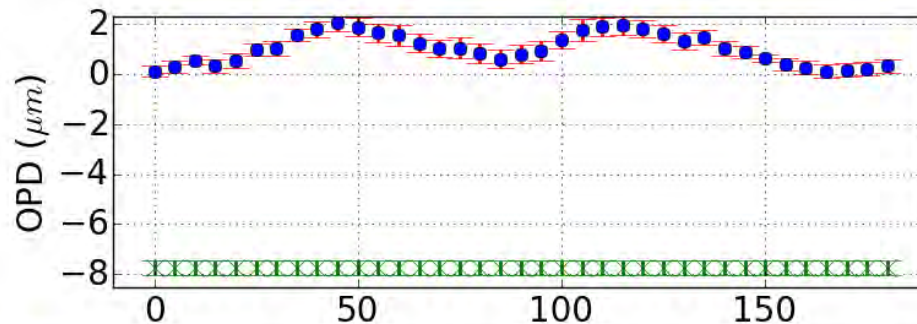

Visibility versus angle with new beam splitter

- Polarization effect from optical fibers

■ ■ Base 2/3 × × Base 2/3 without polarisation

OPDs versus polarisation angle with new beam splitter

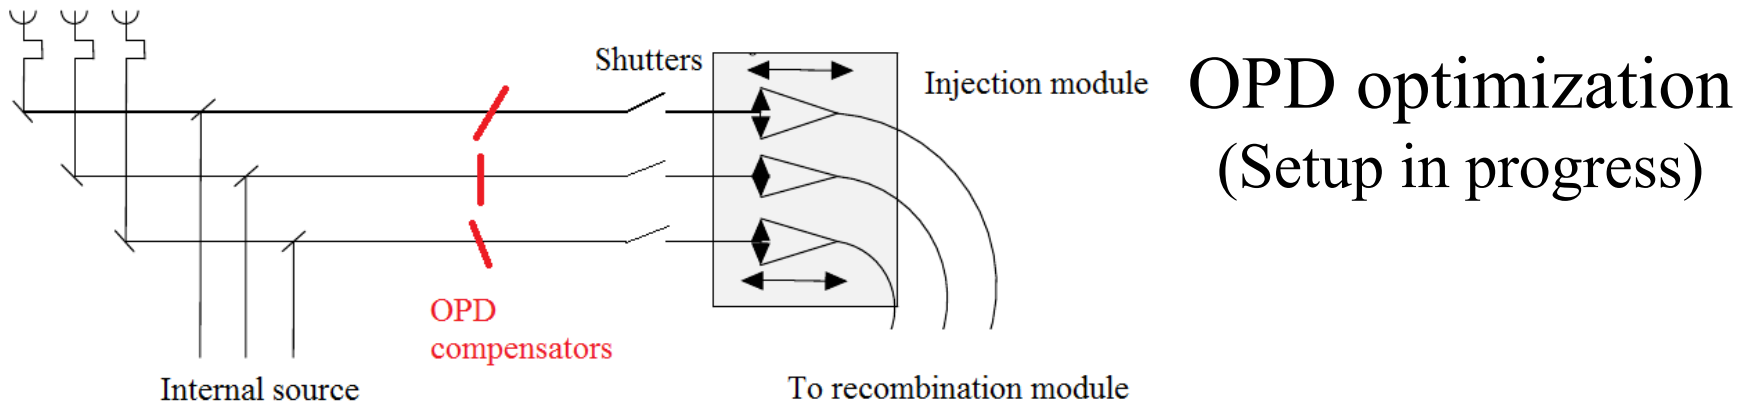

$$\Delta OPD \approx 2 \mu\text{m}$$

■ ■ Base 2/3 × × Base 2/3 without polarisation

Polarization behaviour

Inspired by PIONNIER

Lazareff et al., A&A, 2012

Plates : α BBO cristal

Optimisation before each night

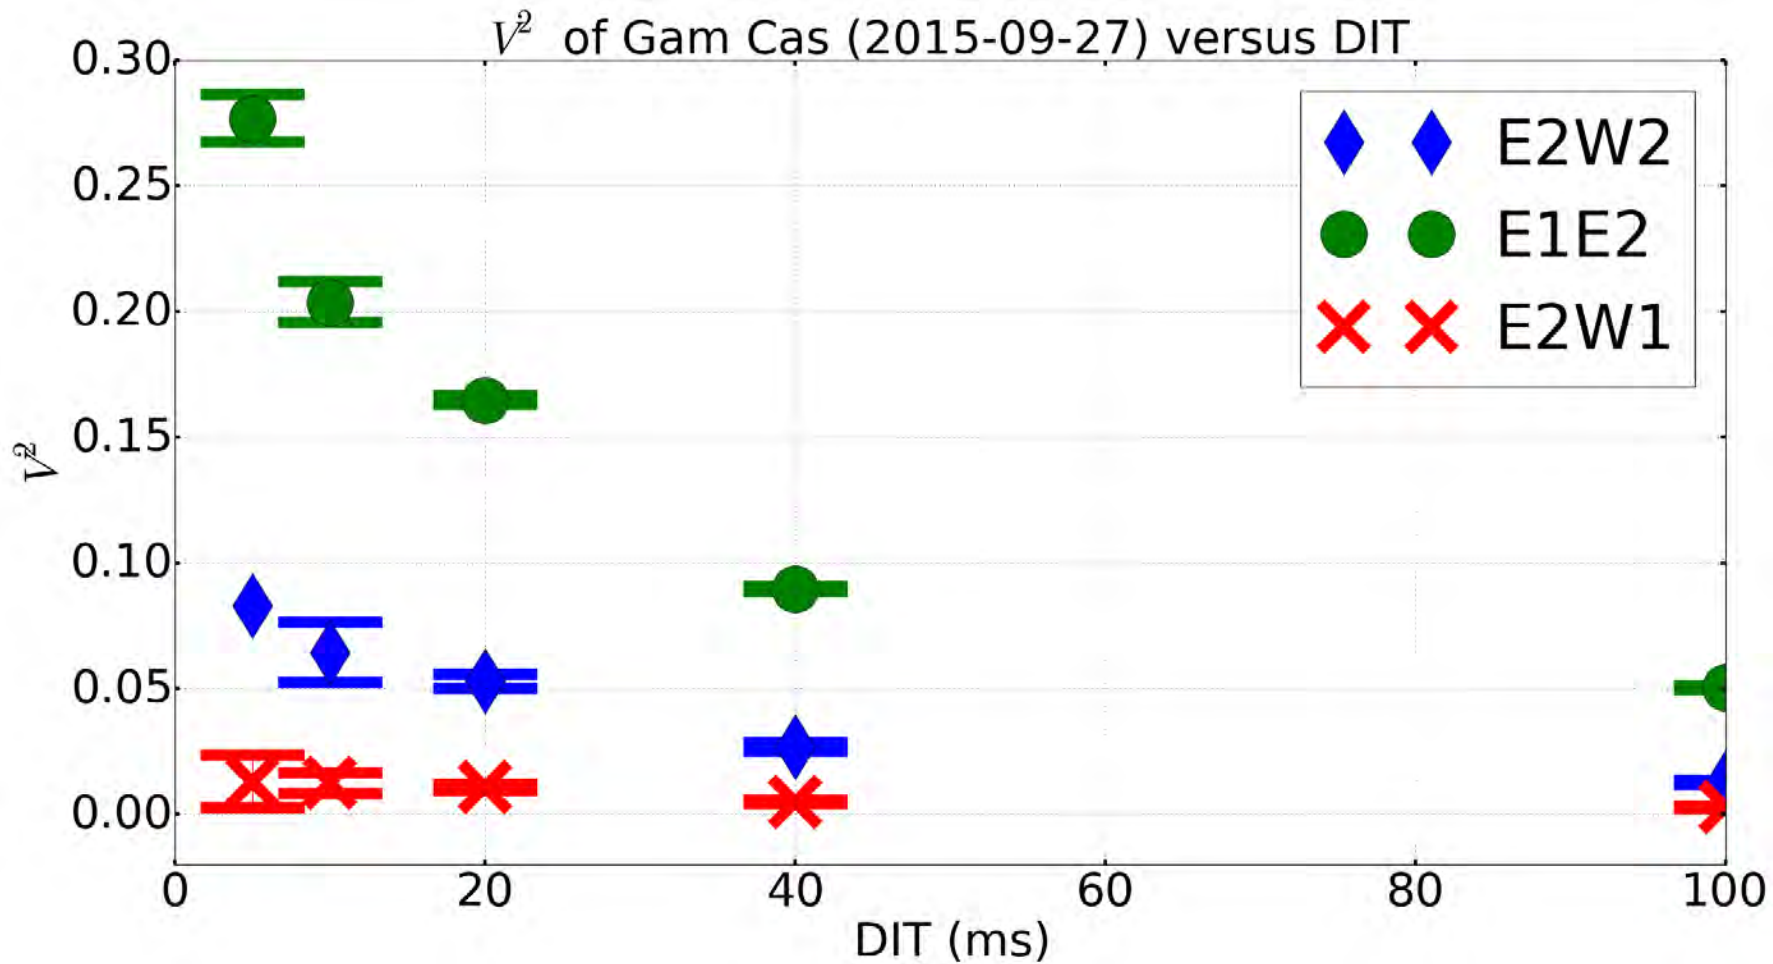

OPTIMAL DIT (DETECTOR INTEGRATION TIME)

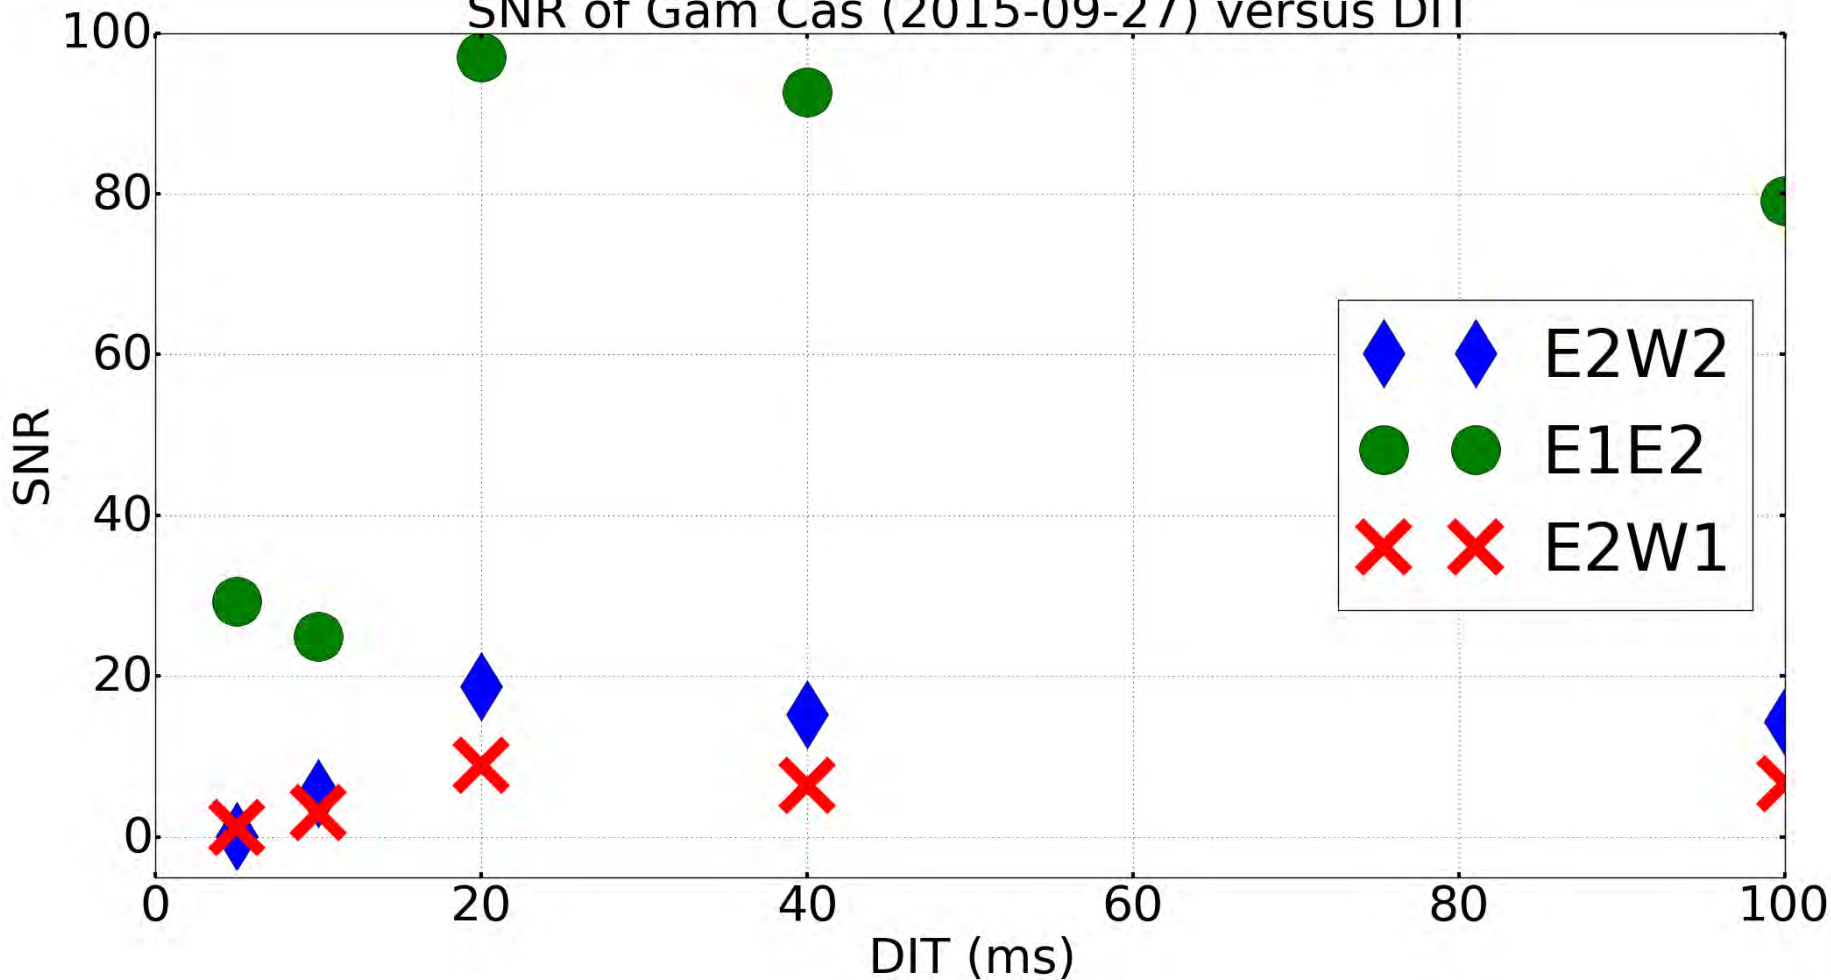

Optimal DIT

Optimal DIT

SNR of Gam Cas (2015-09-27) versus DIT

$\tau_0 \sim 5 - 10 \text{ ms}$ $DIT \sim 2 - 3 \times \tau_0$

Buscher, MNRAS, 1988

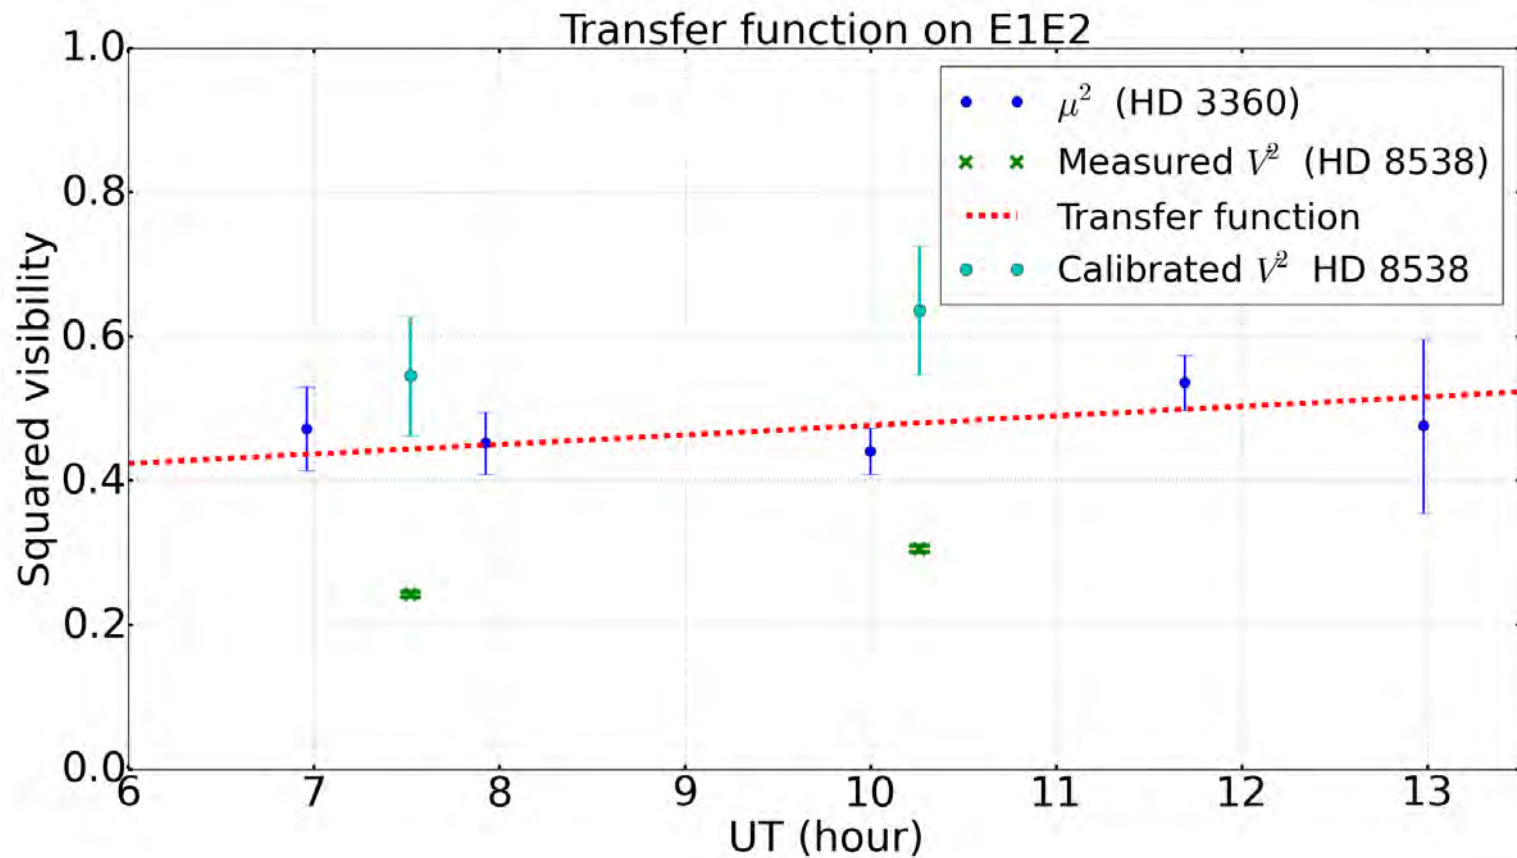

FIRST STELLAR DIAMETER ESTIMATION

Observatoire de la COTE d'AZUR

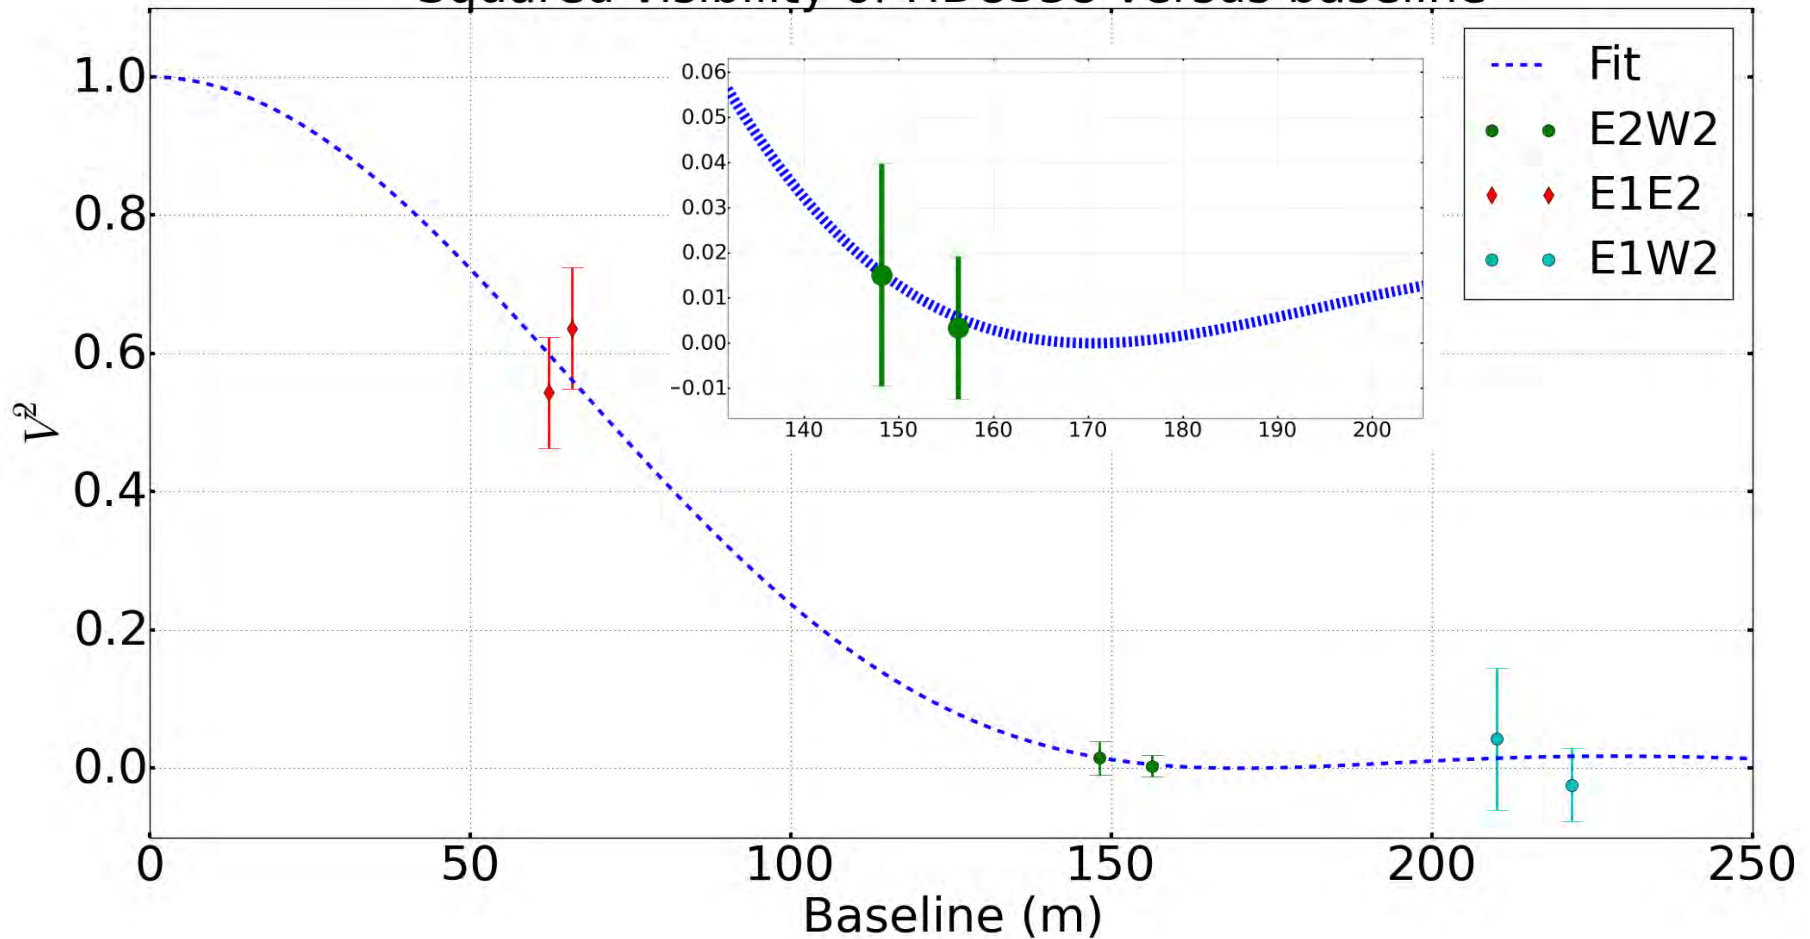

First stellar diameter measurement

- Target : HD8538 (del Cas)
- Calibrator : HD3360 (zet Cas)

First stellar diameter estimation

Squared visibility of HD8538 versus baseline

- Diameter of HD8538 : $1,02 \pm 0,04$ mas

First stellar diameter estimation

- JSDC:
 - Surface brightness method
 - Diameter: 1.22 ± 0.09 mas
- Measured diameter : $1,02 \pm 0,04$ mas
- Difference of few sigmas: transfer function, # of points ?

Conclusion

- Done:
 - Pipeline functional
 - Characterization of birefringence
 - Optimal DIT
 - First measurement of transfer function
 - Measure low visibilities
 - Better comprehension of the detector (temperature, dark current, matrix...)
(More information the 3rd day)
- Next step:
 - OPD optimization (July 2016)
 - Monitoring τ_0 with AO
 - SPIE article (June 2016)
 - Transfer function stability (July 2016)
 - Acquisition sequence: dark-shut1,2,3-fringes-no fringes

Thank you for your attention

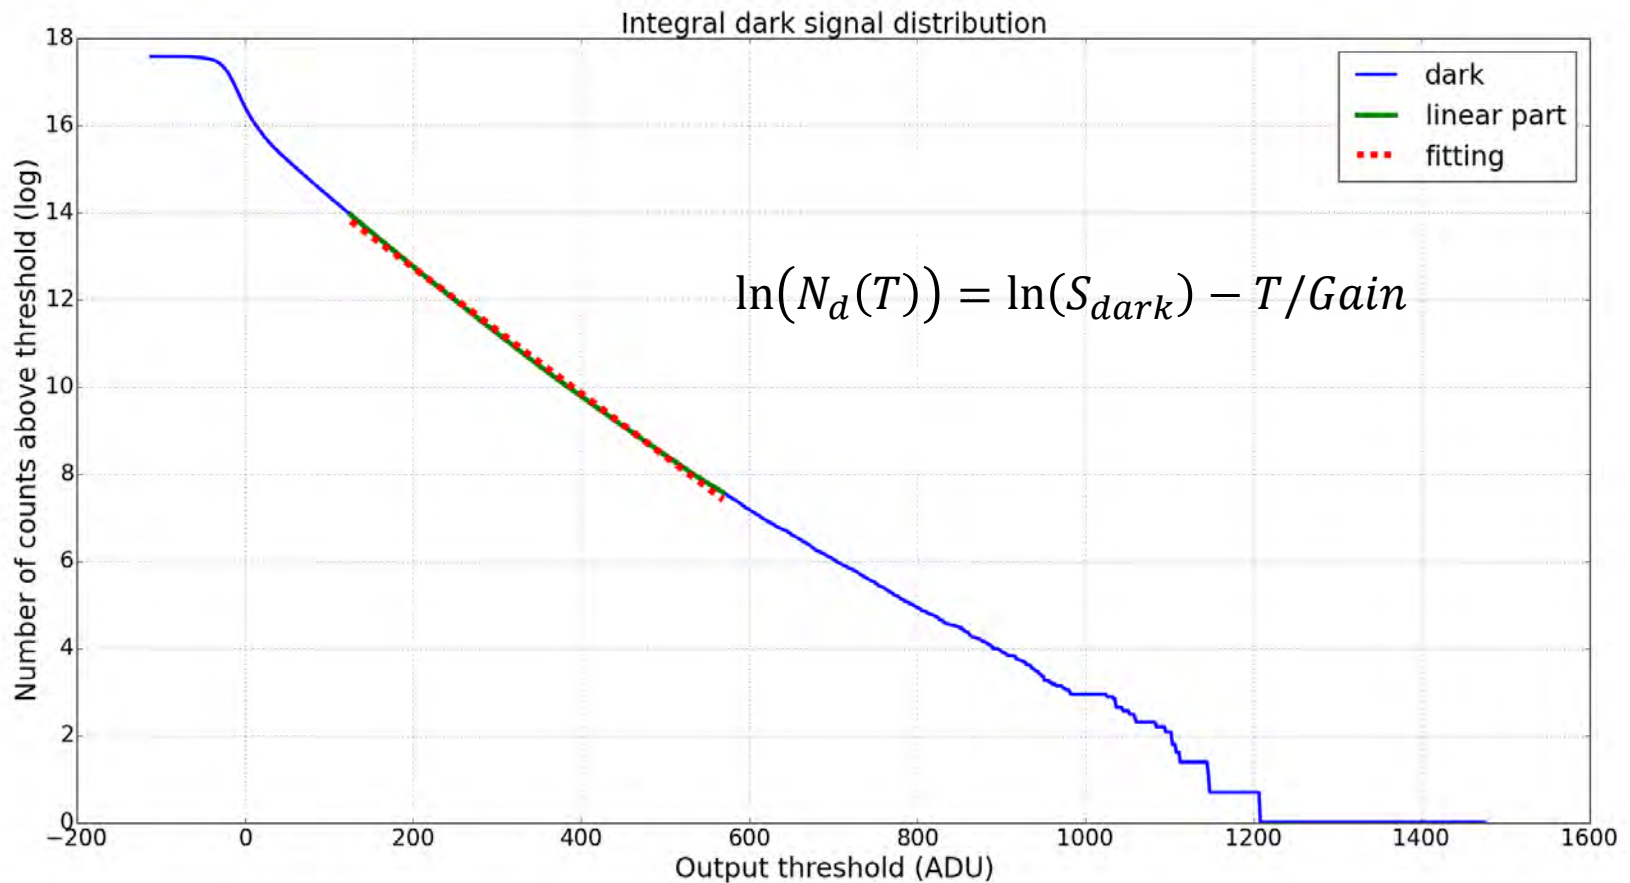

EXTRA DOCUMENTS

Gain map

- Histogram of dark for each part of matrix
